TITLE: A Radio-Controlled Tractor

PERIODICAL: Radio, 1959, Nr 8, pp 17 - 18 (USSR)

ABSTRACT: Remote controls for a DT-54, tractor to be used for ploughing, were developed at the plant "Kraspromavtomatika". An R-106 transmitter working on 46.1 - 48.65 Mc is equipped with a simple audio frequency oscillator producing six frequencies in the range from 200-325 cycles. The transmitter has a range of 3 km and is powered by 2NKN-24 batteries. The antenna is 1.5 m long. A RUM-1 receiver and nine relays are installed on the tractor. The receiver reproduces the six different audio frequencies which cause oscillations of six resonance relay reeds. The vibrations of the reeds close the contacts of polarized relays, which in turn actuate the RKS-3 power

A Radio-Controlled Tractor

relays. The power relays close the circuits of electromagnets operating the valves of the hydraulic system, which actuates the controls of the tractor. Six commands are possible, according to which the tractor will start or stop, turn right or left, raise or lower the plough. Six differently-colored lamps are mounted on the roof of the tractor, indicating the proper reception of the signal and the functioning of the controls. The receiver is mounted on rubber cushions. The polarized relays are suspended by springs to a common panel. The receiver may be fed from dry cells or from the battery installed on the tractor, using a transistorized converter. The transmitter of the RUM-1 remote control equipment, widely used for aircraft and ship models, proved inadequate, because of the low stability of the carrier and modulation frequency. Additional equipment is

SUPRUNENKO, D. A.

Suprunenko, D. A. Irreducible nilpotent matrix groups of prime degree. Mat. Sbornik N.S. 31(73), 353-358 (1952). (Russian)

Let Ω be an algebraically closed field, p a prime number, $GL(p, \Omega)$ the full linear group of degree p over Ω , M the multiplicative group of Ω . The author proves the following three theorems. 1. If p is not the characteristic of Ω , then there exist (finitely) nilpotent irreducible matrix groups over Ω whose centre is equal to M , with an arbitrary preassigned length of the upper central series. 2. Let Γ and Γ' be nilpotent irreducible matrix groups of degree p over Ω with centre M , and let l, l' be the lengths of the upper central series of Γ, Γ' respectively. If $l=l'$, then Γ and Γ' are conjugate in $GL(p, \Omega)$; if $l>l'$, then Γ contains a subgroup conjugate to Γ' in $GL(p, \Omega)$. 3. The index of the centre of a nilpotent irreducible matrix group of degree p over Ω is equal to p^l , where l is the length of the upper central series. (The restriction on the centre in theorems 1 and 2 is not very serious, since for any nilpotent irreducible group Γ over Ω the group ΓM is also nilpotent and has centre M .)

Title : Irreducible nilpotent matrix groups

Periodical : Mat. sbor., 35 (77), pp 501-512, Nov-Dec 1954

Abstract : In the present article the author applies the results of his earlier work ("Irreducible nilpotent matrix groups of prime degree," ibid., 31 (73), 353-358, 1952) to nilpotent irreducible groups of matrixes whose power does not possess quadratic divisors. He also describes meta-Abelian irreducible groups of matrixes of arbitrary power over an algebraically closed field. The conditions necessary and sufficient for the existence of nilpotent irreducible groups of matrixes of given power over an algebraically closed field are demonstrated. Five references, USSR.

Let P be an arbitrary field; $P^{(n)}$ the linear n-dimensional space over P ; $GL(n, P)$ the full linear group, i.e. the group of all non-degenerated linear transformations of $P^{(n)}$. The author considers the solvable subgroups of $GL(n, P)$. At first several lemmas on irreducible imprimitive subgroups of $GL(n, P)$ are proved and a very simple proof of a Clifford's theorem (Ann. of Math. 38, 533-550 (1937)) is given. Then the author investigates the maximal primitive irreducible solvable subgroup of $GL(n, P)$ and the series

$$\Gamma \supseteq V \supseteq A \supseteq F \supseteq E.$$

Here Γ denotes the maximal irreducible primitive solvable subgroup of $GL(n, P)$; F is the maximal Abelian normal divisor of Γ ; V is the centralizer of F in Γ ; A/F is the maximal group among the Abelian normal divisors Γ/F which are contained in V/F . F is the multiplicative group of the field Σ which is contained in the full linear algebra P_n over P , where $\Sigma: P = m, m/n$. V/A can

Suprunenko, Dmitriy Alekseyevich

Razreshimyye i nil'potentnyye lineynyye gruppy (Solvable and Nilpotent Linear Groups) Minsk, Izd-vo Belgosuniv., 1958. 92 p. 2,000 copies printed. Errata slip inserted.

Sponsoring Agency: Belorusskiy gosudarstvennyy universitet.

Ed.: V.G. Kravtsov; Tech. Ed.: Ye.I. Yarish.

PURPOSE: This book is intended for mathematicians specializing in group theory.

COVERAGE: The book contains a general synthesis of articles written by the author on linear solvable groups and on linear nilpotent groups. In studying solvable subgroups of the complete linear group, attention is concentrated mainly on maximal solvable subgroups, the study of which is reduced to the study of maximal primitive solvable subgroups of a complete linear group over any arbitrary field. Series of results are presented concerning the construction of maximal primitive subgroups of a complete linear group. The author gives a complete description of maximal solvable irreducible subgroups $GL(n, P)$, where P is an algebraically closed field, and : a number without quadratic divisors, the construction of which is reduced to the construction of maximal solvable subgroups of symplectic

abstract no.8619. Tr. In-ta fiz. i matem. AN BSSR, 1959,
no.3, 213-220

TEXT: It is proved that the maximal irreducible Abelian subgroup of the complete linear group $GL(n, p^m)$ over the finite field $GF(p^m)$ is almost always the maximal nilpotent subgroup of $GL(n, p^m)$. An exception is the case when simultaneously $n = 2$, $m = 1$, and p is a prime number of Mersenne. In this case the maximal irreducible Abelian subgroup of $GL(2, p)$ is contained in a nilpotent group of the order $2(p^2-1)$. A mark for the existence of irreducible metabelian subgroups in $GL(n, p^m)$ is given. If n and $p^{m \cdot n} - 1$ are relatively prime then every irreducible nilpotent subgroup of $GL(n, p^m)$ is commutative. X

abstract no.8620. Tr. In-ta fiz. i matem. AN BSSR, 1959,
no.3, 221-233

TEXT: The authors describe a simple method for the reduction of the investigation of arbitrary nilpotent linear groups over the algebraically closed field P to the investigation of irreducible nilpotent groups. Basing on this construction and on earlier results the authors prove the following facts. 1) All maximal nilpotent subgroups of $GL(n, P)$ of the class $1 > n-1$ decompose into an only finite number of classes of conjugate subgroups. 2) The number of non-conjugated maximal locally nilpotent subgroups of $GL(n, P)$ is smaller than or equal to the number of representations of the number n in the form: $n = k_1 \frac{n_1}{k_1} + k_2 \frac{n_2}{k_2} + \dots + k_s \frac{n_s}{k_s}$,

where $\frac{n_i}{k_i}$ are not divisible by the characteristic of the field P.

SOV/39-49-3-7/7

TITLE: On Real Linear Nilpotent Groups

PERIODICAL: Matematicheskiy Sbornik 1959, Vol 49, Nr 3, pp 347-352 (USSR)

ABSTRACT: The author investigates irreducible nilpotent subgroups of the complete linear group $GL(n, D)$, where D is the field of all real numbers. He proves : 1.) for every even $n \geq 2$ and $l > 1$ $GL(n, D)$ possesses irreducible nilpotent subgroups of the nilpotence class l 2.) for odd n $GL(n, D)$ has no irreducible nilpotent subgroups 3.) for even n there exist in $GL(n, D)$ only finitely many non-conjugate maximum irreducible nilpotent subgroups of given nilpotence class 4.) if n is no power of 2 , then the description of the maximum irreducible nilpotent subgroups of given nilpotence class 1 is reduced from $GL(n, D)$ to the same problem for $GL(n/2, K)$, where K is the field of the complex numbers. As an example the author describes irreducible nilpotent subgroups of $GL(2, D)$.

TITLE: Maximal commutative matrix algebras and maximal commutative matrix groups

SOURCE: AM BSSR. Doklady, v. 8, no. 7, 1964, 425-428

TOPIC TAGS: mathematic matrix, group theory

Abstract: Let L be the set of all maximal commutative subalgebras of the algebra Δ_n , where Δ is any field. Δ_n an algebra of all $n \times n$ matrices over Δ , and K the set of all maximal commutative subgroups of the group $G = \Delta_n^\times$. Then, the author proves that almost everywhere there exists a one-to-one correspondence from L to K that the algebras in L correspond to the subgroups of K and the signum subgroups of K map onto the nilpotent subalgebras of L , in condition that the field Δ has more than two elements, since then the number of elements in L is greater than the number of elements in K .

In terms of categories the above statement is as follows: Let $n > 1$ and let L_n and K_n be categories. There exists an isomorphism between L_n and K_n if and only if the base field has at least three elements. Two

Card 1/2

problems are posed, namely:

- 1) To what extent is the relationship between L and K preserved when the field is replaced by a local commutative ring?
- 2) What is the relationship between L and K in the case of infinite dimensional linear spaces over the field?

e.g. art. has 7 formulas.

ABSTRACT: In a previous article (Sibirskiy Matematicheskiy Zhurnal, Vol 6, No 6) the author proved a theorem that makes it possible to find a simple example of an insoluble, locally finite p-group of matrices for a commutative ring. The present article gives an illustration of such an example. Orig. art. has: 5 formulas.

ABSTRACT: Let $Gl(n, R, p^m)$ be the group of all invertible $n \times n$ matrices over $R/(p^m)$, where R is the principal ideal domain, p is an irreducible element of the ring R , m is a positive integer. Then: Theorem 1. For any two matrices $E + pA$ and $E + pB$ in $K(n, R, p^m)$ the equation $(E + pA; E + pB) = E + [A, B] \sum_{t=1}^{m-1} (-p)^t F_{t-2}$ holds. Theorem 2. For $n, m \geq 1$, $K(n, R, p^m)$ is a nilpotent group of class $m - 1$. Elementary remarks on Lie algebras over $R/(p^m)$ and the length of the commutant sequence of the group $K(n, R, p^m)$, together with two examples, are given. Orig. art. has: 33 formulas. [JPRS]

TITLE Dynamic representations and a class of deterministic machines

SOURCE: Kibernetika, no. 2, 1965, 9-17

TOPIC TAGS: dynamic group representation, deterministic machine, deterministic automation, automata control device, permutation calculus, computer design

ABSTRACT: The theory of automatic control devices investigates deterministic systems which are able to operate in discrete time with integral non-negative values. Input signals are discrete, i.e., they are determined by the value of the system state at the instant t. The output signal is also discrete, i.e., it is determined by the state of the system at the instant t + 1. The present paper studies the problem of finding a dynamic representation of such systems. This problem is reduced to the problem of finding a dynamic representation of a class of deterministic systems leads

L 54568-69
ACCESSION NR AP5012791

the next stage, the instant of the switching on of the representation is also taken into account. The first part of the paper outlines the calculation of dynamic representations and the characteristics of these representations. Part II contains the definition of a method for calculating the representation of a system. Appendix A contains the first section of the article on the representation of systems.

TITLE: ¹⁶ Sylow subgroups of the multiplicative group of a body

SOURCE: Sibirskiy matematicheskiy zhurnal, v. 6, no. 6, 1965, 1382-1387

TOPIC TAGS: mathematics, number theory

ABSTRACT: The article studies the structure of Sylow p-subgroups of the multiplicative group T^* of a body T of finite rank over its center. It is proved that Sylow p-subgroups of T^* , given $p > 2$, are conjugate in T^* . In addition, it is found that a sufficient condition for the conjugateness of Sylow 2-subgroups is that body T contain an infinite noncommutative 2-group. For the case of bodies of positive or zero characteristic and rank $4r$, where r is an odd number, the conjugateness of Sylow p-subgroups is proved for any prime number p . It is shown, in particular, that Sylow p-subgroups in group T^* are conjugate if body T is algebraic over the rational number field R . The authors reported on part of their findings at the Fourth All-Union Mathematical Congress in 1961. Orig. art. has 7 formulas. [JPRS]

TITLE: Maximal nilpotent subgroups of a full linear group over factor ring $Z/(p^{\sup m})$

SOURCE: Matematicheskiy sbornik, v. 66, no. 4, 1965, 598-607

TOPIC TAGS: mathematic matrix, linear function

ABSTRACT: Let Z be a ring of rational integers, p a prime number, m a positive integer, and $GL(n, Z, p^m)$ the group of all invertible $n \times n$ matrices over factor ring $Z/(p^m)$. Given $m = 1$, then $GL(n, p)$ is written in place of $GL(n, Z, p^m)$. The group of all invertible $n \times n$ matrices over the finite field $GF(p^r)$ of p^r elements is designated by the symbol $GL(n, p^r)$. The author, in articles by him and R. F. AFATINOK, studied maximal irreducible nilpotent subgroups of $GL(n, p^r)$, while in an article by him and R. I. TYSKEVICH the study of maximal locally nilpotent subgroups of a full linear group over a perfect field led to a study of maximal irreducible nilpotent subgroups of a full linear group. This article describes maximal nilpotent subgroups of the group $GL(n, Z, p^m)$ by means of maximal nilpotent subgroups of the group $GL(n, p)$. The author outlines the proof of the following fundamental theorems:

Cord 1/2

UDC: 519.41/47

L 22107-66

ACC NR: AP6012669

Theorem 1. Let Γ be a maximal nilpotent subgroup of group $GL(n, p)$. Then there exist in $GL(n, Z, p^m)$ maximal nilpotent subgroups \mathcal{H}_1 such that

$$\gamma(\mathcal{H}_1) = \Gamma.$$

All maximal nilpotent groups of group $GL(n, Z, p^m)$ possessing the above property are conjugate in $GL(n, Z, p^m)$.

Theorem 2. If \mathcal{H}_2 is a maximal nilpotent subgroup of group $GL(n, Z, p^m)$, then $\gamma(\mathcal{H}_2)$ is a maximal nilpotent subgroup of group $GL(n, p)$. Orig. art. has: 18 formulas. [JPRS]

TITLE: Locally nilpotent matrix groups over an arbitrary field

SOURCE: Matematicheskiy sbornik, v. 68, no. 4, 1965, 614-622

TOPIC TAGS: mathematic matrix, mathematics, nilpotent subgroup

ABSTRACT: The author studies maximal, locally nilpotent, absolutely irreducible subgroups of the full linear group $GL(n, \Delta)$, where Δ is an arbitrary field. There are absolutely irreducible, locally nilpotent subgroups in group $GL(n, \Delta)$ if and only if, for any simple divisor q of number n in multiplicative group Δ^* of field Δ , there exists an element of order q . The case of arbitrary degree n here fully reduces to the case in which $n = q^d$, where q is a prime number. If Γ is a maximal, locally nilpotent, absolutely irreducible subgroup of group $GL(q^d, \Delta)$, then Γ/Δ^* is a Sylow q - subgroup of factor group $GL(q^d, \Delta)/\Delta^*$. It is proved that a maximal, locally nilpotent, absolutely irreducible primitive subgroup of group $GL(n, \Delta)$ possesses an irreducible Abelian normal divisor. The article describes maximal, locally nilpotent, absolutely irreducible subgroups of group $GL(n, \Delta)$ which possess irreducible Abelian normal divisors. Orig. art. has: 30 formulas.

TITLE: The investigation of the effect of high-temperature heating on the position of the Curie point of ferrochrome alloys

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 12, abstract 6170 ("Visnyk Kyyiv's'k. un-tu", no. 1, 1958, ser. fiz. ta khimiya, no. 1, 137 - 138, Ukrainian; Russian summary)

TEXT: Investigated were ferrochrome alloys containing 45, 47 or 49 at. % of Cr. The samples were annealed at 1,200°C. The heating of the samples was carried out at a rate of 200 degrees/hour. It was determined that the Curie temperature for ferroalloys containing 45 at. % of Cr after annealing for 26 and 114 hours equals 423 and 451°C, respectively, (prior to annealing 405°C). The Curie temperature for samples containing 47 at. % of Cr after annealing for 24 and 90 hours equals 379 and 393°C, respectively, (prior to annealing 367°C). For alloys, containing 49 at. % of Cr after annealing for 24 and 100 hours, the Curie temperature is 335 and 355°C, respectively, (prior to annealing 328°C). The

TITLE: Investigation of the sigma-phase in iron-chromium alloys

PERIODICAL: Referativnyj zhurnal, Metallurgiya, no. 7, 1962, 23, abstract 7I136
("Visnyk Kyiv's'k. un-tu", 1958, no. 1, ser. fiz. ta khimii, no. 1,
139 - 141, Ukrainian; Russian summary)

TEXT: Results of dilatometric investigations of the electric resistance and magnetic saturation of the σ -phase in Fe-Cr alloys containing 45, 47, and 49 at% Cr are presented. The elongation $\Delta l/l$ of the sample depends upon the rate of heating; the smaller the latter the smaller is $\Delta l/l$. For all alloys was observed an inflection in the course of the curves $l = f(T)$ at 520°C , which is weaker and shifts towards the region of higher temperature with an increase in the rate of heating. A decrease of resistance was observed with the alloy containing 49 at% Cr at a holding time of more than 180 hrs at 500°C . No changes in magnetic saturation of samples annealed during about 400 hrs at 500°C could be observed.

TITLE: Some anomalous properties of α -Ti

PERIODICAL: Ukrayins'kyy fizichnyy zhurnal, v. 7, no. 11, 1962,
1242-1245

TEXT: Metals in which the last Brillouin zone is almost completely filled exhibit as a rule absorption bands in the red and infrared regions. The band width is assumed to correspond to an energy ΔE . If such metals are heated, a part of the electrons will probably pass into the almost empty higher energy where their mobility will be greater. This will cause an increase in the conductivity and the temperature dependence of the resistance will therefore differ from that of other metals. In the case of α -Ti $\sigma = \sigma_1 + \sigma_2$, σ_1 being the conductivity when the passage of electrons can be neglected. The resistance $\sigma_1 = 1/\rho_1$ can be found by extrapolation to high temperatures. Assuming that the conductivity can be described as for a semiconductor, except that the mobility of an

Card 1/2

Some anomalous properties ...

S/185/62/007/011/014/019
D234/D308

electron is proportional to $1/T$ and the Fermi energy is practically independent of temperature, $\ln(\Delta\rho/\rho) - (5/2) \ln T$ must depend linearly on $1/T$. This is confirmed graphically, and the value of ΔE was found to be 2.8 kcal/mole. The deviation of the heat capacity from 5.95, found by a similar method, is 2.4 kcal/mole, which agrees well with experimental data. According to the above, an infrared absorption band near 11 microns is to be expected. There are 4 figures.

TITLE: Estimate of the heats of phase conversions and the energy of vacancy formation in simple metals

SOURCE: Fizika tverdogo tela, v. 8, no. 5, 1966, 1329-1335

TOPIC TAGS: phase transition, allotropic transformation, electron structure

ABSTRACT: It is assumed that the principal contribution to the heat effect in conversion is due to the variation in internal energy at $T=0^{\circ}\text{K}$. The latter is computed by using the potential of the metal in the free electron approximation and the virial theorem. It is shown that the heat of fusion of monovalent metals is proportional to the Fermi energy and the relative change in volume. Calculations agree well with experiment. For multivalent metals it was necessary, in addition, to account for the change in internal energy owing to the redistribution of the valence electrons over the energy bands. The magnitude of the redistribution of valence electrons in allotropic conversions of tin and thallium and in the fusion of aluminum is estimated. Results are tabulated and compared with the data in the literature and pertinent energy bands are presented schematically. Orig. art. has: 2 figures, 3 tables.

TITLE: Strong Focusing in a Linear Accelerator

PERIODICAL: Atomnaya energiya, 1960, Vol 8, Nr 2, pp 127-133
(USSR)

ABSTRACT": Application of strong focusing in linear accelerators. The strong focusing method was proposed by Courant, Livingston, Snyder, and Blewett (see refs at end of abstract) in 1952, while Zel'manov suggested in 1953 that a lens be put at the origin of the focusing system. This half lens and multiple periodicity proposed by Ya. B. Faynberg, A. I. Akhiyezer, and K. N. Stepanov lead to a substantial reduction of the field gradient needed for focusing. A. A. Sharshanov developed a method for setting up approximate solutions of the equation for particle oscillations in the paraxial region of the accelerating system due to the alternate focusing and defocusing forces of the quadrupole lens:

SOV/89-8-2-7/30

$$\frac{d^2x}{d\xi^2} + \Omega^2(\xi)x = \epsilon/(x, \xi), \quad (1)$$

where $\Omega^2(\xi)$ is quasi-periodic function of alternating sign; ϵ , a small parameter; $\xi = \frac{x}{\lambda}$, dimensionless longitudinal coordinate; λ , wavelength; $\beta = \frac{v}{c}$, relative velocity. Since older references contained only approximate diagrams of stable regions, the authors calculated regions of stability sufficiently accurate to be useful for practical purposes. They are shown in Figs. 1-3 for various combinations of focusing and defocusing lenses and consequently, various values for Γ_{IF} and γ , computed for the case that:

$$\Omega(\xi) = \begin{cases} \frac{1}{1-\alpha} Y & \text{in the defocusing lens} \\ \alpha X & \text{in the accelerating gap} \\ \frac{1}{1-\alpha} Y & \text{in the focusing lens} \end{cases}$$

while

$$X^2 = \frac{Z \alpha \pi e V k \lambda^2}{4 m c^2 p} \sin \varphi_0 \quad (3)$$

In the case of electrostatic lenses:

$$Y^2 = \frac{Z(1-\alpha)^2 e V k \lambda^2}{4 m c^2 p^2} \quad (4a)$$

and in the case of magnetic lenses:

$$Y^2 = \frac{300 Z (1-\alpha)^2 e H' \beta \lambda^2}{4 m c^2} \quad (4b)$$

where H' is gradient of the magnetic field; V , potential differences on lens electrodes; k ,

coefficient depending on shape of electrodes; $2a$, lens aperture; α , ratio of gap length to length of the period ($\alpha = 0.25$); Z , A are respective charge and mass numbers; ϕ_s is synchronous phase; E , average over the accelerator length of field strength amplitude of the accelerating field; G , utilization factor of the accelerating field (for $\alpha = 0.25$, maximum value of $G = 0.9$); IF subscript with I refers to the initially focusing planes.

Fig. 1. Stability region
for $N = 1$.

Card 4/15

Stability Focusing in a Linear Accelerator

Fig. 2. Stability region for $N = 2$.Fig. 3. Stability region for $N = 3$.

N represents the number of successive lenses of the same sign (multiple periodicity). Choosing the working point in the middle of the stability region, the potential on the lenses decreases as $2-(N-1)$.
